

Step 1 : Added the possibility of changing the color.

Step 2 : Lights now affect the material using the Lambert model (dot product), and specular lighting has been added using the Blinn-Phong model.

Step 3: Use two moving normal maps that are blended together to simulate waves.

Step 4 : Added a sine wave using NVIDIA's Equation 8a.

Step 5 : Added multiple Gerstner waves using NVIDIA's Equation 9 and summed them together.

Step 6 : Added dynamic tessellation that adapts based on the camera's distance.

Step 7: Added depth-based coloring, making deeper water appear darker.

Step 8 : Added surface foam using a Voronoi pattern.

Step 9 : Added shoreline foam and waves using a pre-existing Voronoi pattern.
